

GET /invoice-settings

Returns the authenticated user's organization's invoice look, with every default filled in. No `organization_id` is sent or accepted — it comes from the token, so ABC's settings can never be read or written by XYZ. Response is exactly the shape you specified:

- `template` — `classic` | `modern` | `compact` | `thermal`
- `paper_size` — `A4` | `A5` | `thermal`
- `branding` — `logo_file_id`, `signature_file_id`, `primary_color`
- `fields` — the fifteen booleans: `show_company_gstin`, `show_customer_gstin`, `show_billing_address`, `show_shipping_address`, `show_hsn_sac`, `show_mrp`, `show_discount`, `show_tax_rate`, `show_tax_amount`, `show_batch_number`, `show_expiry_date`, `show_bank_details`, `show_upi_qr`, `show_terms`, `show_signature`
- `terms`, `footer_text`, `notes`

A firm that has never touched it still gets a complete object back (`classic` / `A4` / sensible toggle defaults), so the form always has something to bind to.

PATCH /invoice-settings

Partial update. `branding` and `fields` **merge key by key**, so you can flip one toggle or set just the logo without resending everything else. An invalid `template` or `paper_size` is 422. Every change is recorded against the organization's activity log. Admin-gated.

That is the whole API surface — **there are no separate endpoints for logo, signature, colour or fields**, and the smoke suite asserts that nothing under `/invoice-settings/...` exists so none can creep back in.

Uploading the logo and signature

Use the universal `POST /files/upload` (no record id needed) and put the returned value into `branding.logo_file_id` / `branding.signature_file_id`. Either the bare `file_id` or the full `/files/{id}` URL works — both resolve. A file belonging to another firm is ignored rather than printed, and an image the renderer can't decode is skipped so a bad upload never costs the firm its invoice.

GET

`/invoices/{invoice_id}/pdf?format=simple` and `?format=detailed`

Unchanged endpoints, same single Invoice record, now rendered from **invoice data + organization invoice settings + logo + signature:**

- `template` decides the look: `classic` is the plain ruled invoice with every cell boxed; `modern` puts the title reversed out of a band of the brand colour with horizontal rules only and larger type; `compact` tightens type, row height and margins so a long bill fits on one page; `thermal` prints as an 80mm till roll — small type, no ruling, and the two-column "billed to / invoice details" header stacks into one narrow column instead.
- `paper_size` sets the page (A4 / A5 / 80mm). Choosing the thermal *template* prints on a roll regardless of paper size, since that is what choosing that look means.
- `primary_color` colours the title, or fills the header band on `modern`.
- `logo_file_id` prints as the letterhead.
- `signature_file_id` prints above the "Authorised signatory" line — and only when `show_signature` is on. With no signature uploaded you still get the blank line to sign by hand.
- **The fifteen toggles** decide what appears. On the detailed format the line-item **columns are assembled from them**, so a firm that doesn't print HSN or MRP gets a narrower table rather than empty columns. `show_batch_number` and `show_expiry_date` now show real data from the lot the goods left in.
- `terms`, `notes` and `footer_text` print at the foot; `show_terms` gates the terms.
